

# About Planar Graph

# What is this?

- A. A cup
- B. A picture of a cup
- C. A donut
- D. A picture of a donut
- E. A picture of a donut  
pretending to be a  
cup

# Planar Graph

- Euler's Equation

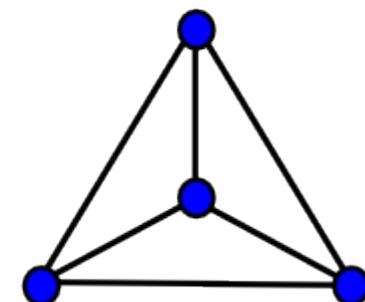

- If a graph is planar,

$$V - E + F = 1 + C$$

- $V$  = # vertices
    - $E$  = # edges
    - $F$  = # faces
    - $C$  = # components

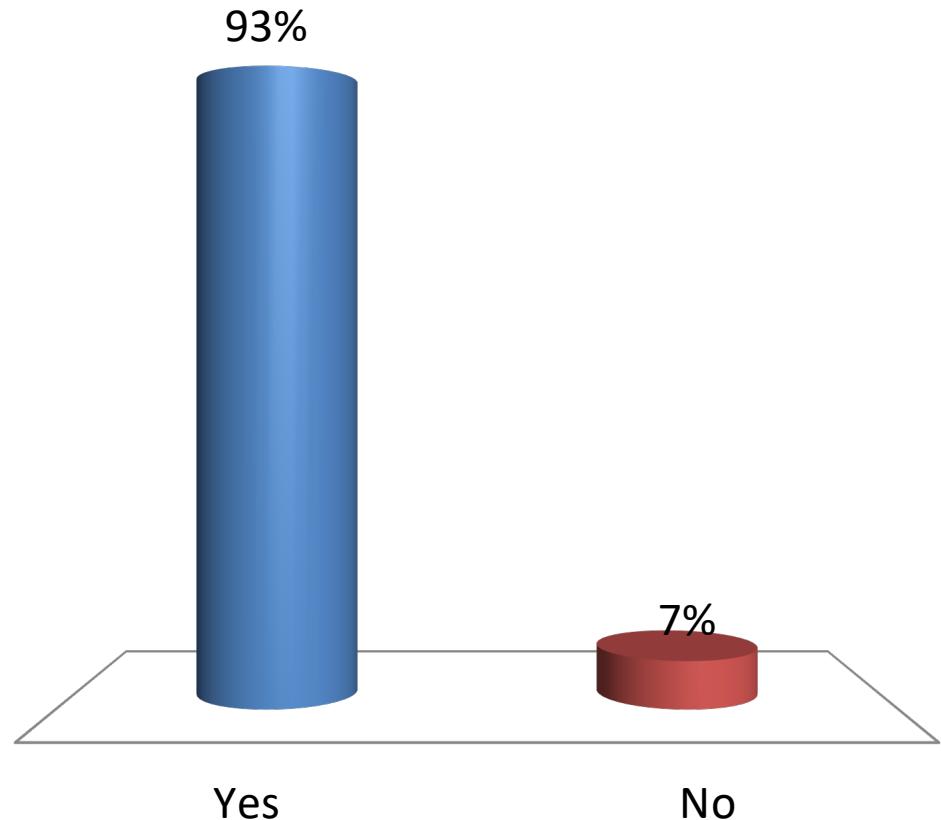

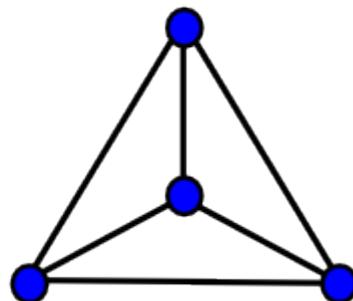

- $V = 4, E = 6, F = 4, C = 1$

- $4 - 6 + 4 = 2 = 1 + 1$

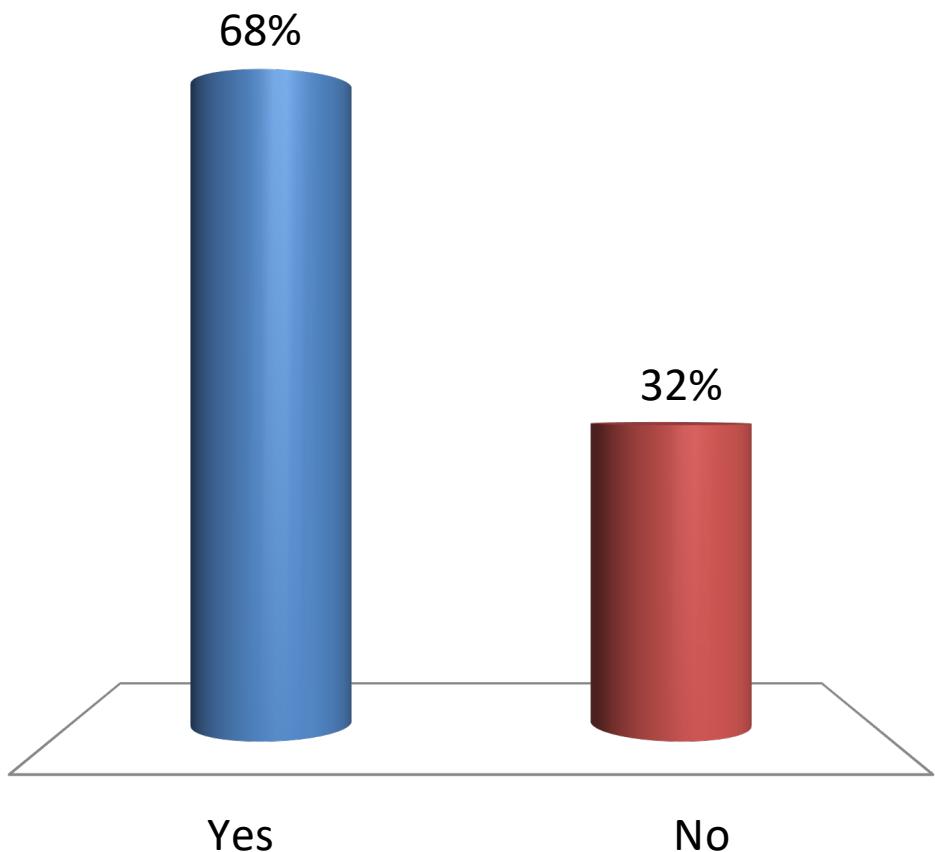

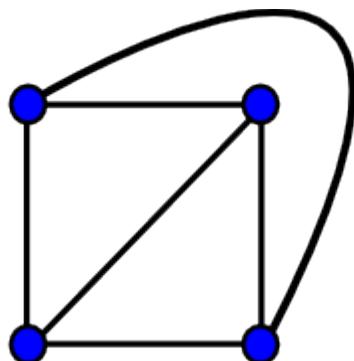

# Is it a planar graph?

- A. Yes
- B. No

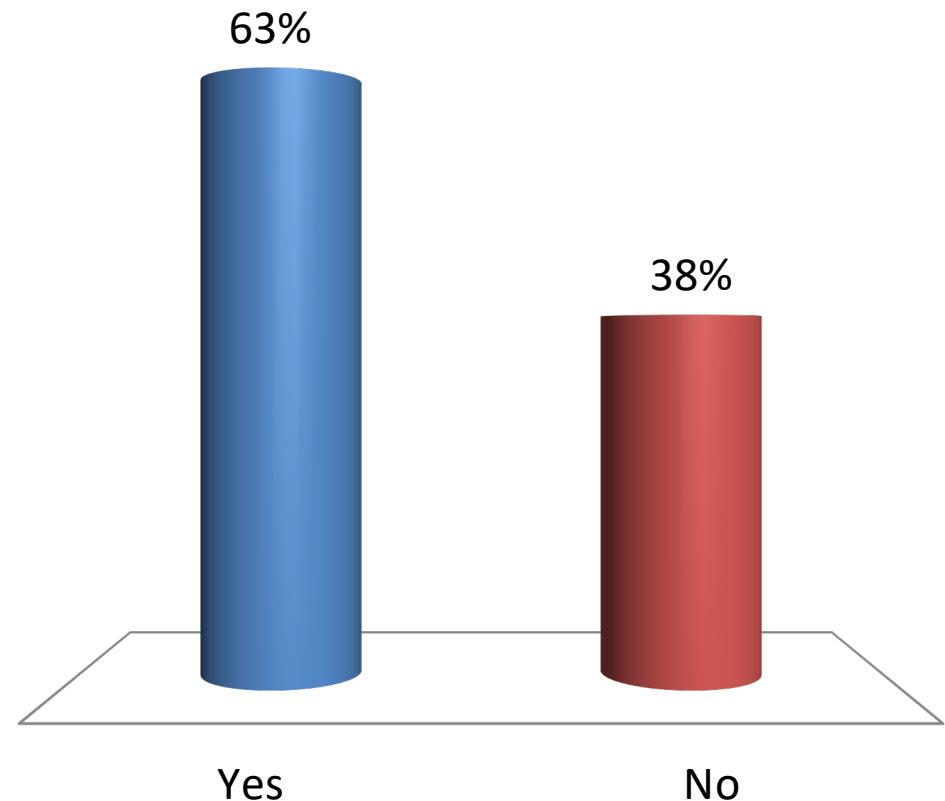

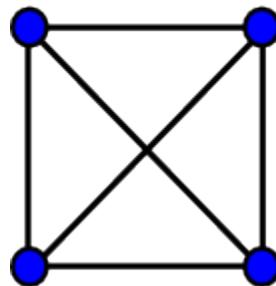

# Is it a planar graph?

- A. Yes
- B. No

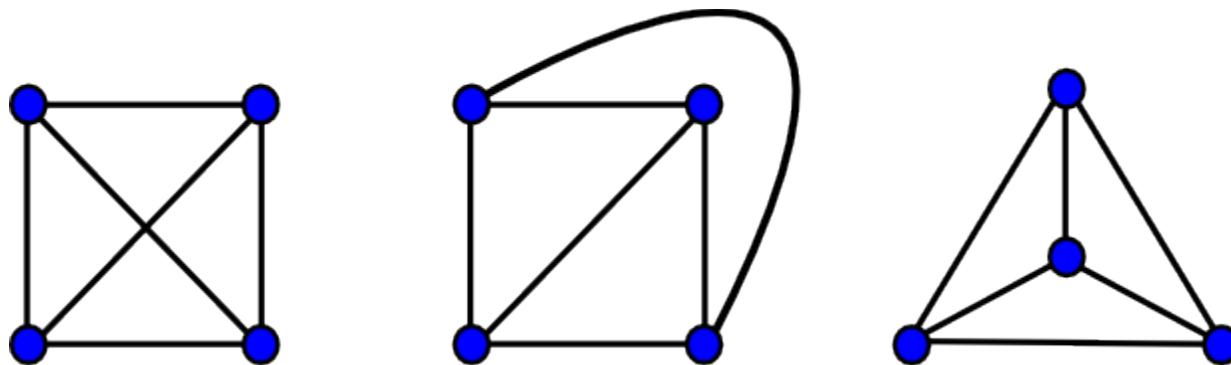

# Is it a planar graph?

- A. Yes
- B. No

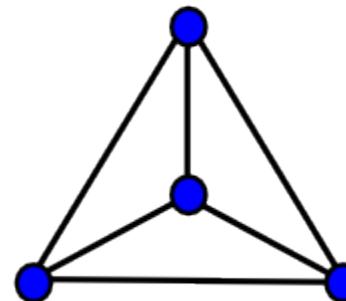

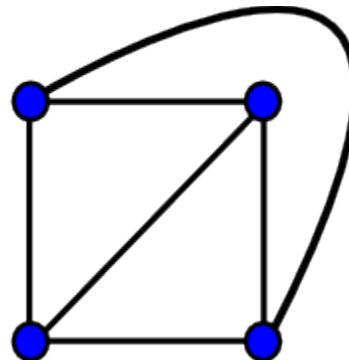

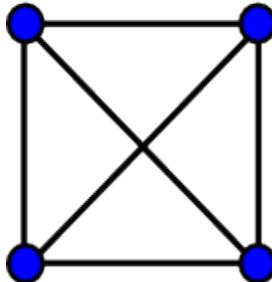

# They are all the same graph

- They are all  $K_i$  is a complete graph for  $i$  vertices

# In a Topologist eye

- $G = \{V, E\}$ 
  - $V = \{a, b, c, d\}$
  - $E = \{ (a, b), (a, c), (a, d), (b, c), (b, d), (c, d) \}$

- Topology cares about connectivity

# Geometry vs Topology

- Geometry
  - deals with shapes and relative **positions** and **sizes** of figures, and properties of space such as **curvature**.
- Topology
  - studies the properties of space that are preserved under continuous deformations, this means stretching and bending but not cutting or gluing.

# (Topology) Definition

- An embedding of an *abstract simplicial complex* is how you draw it out in a  $d$ -dimension space

- A graph is planar if there exists an embedding in a plane

# Embedding

A:  $\{A,C\}, \{A,D\}, \{A,B\}, \{A,E\}$   
B:  $\{B,A\}, \{B,D\}, \{B,E\}$   
C:  $\{C,A\}, \{C,E\}, \{C,D\}$   
D:  $\{D,C\}, \{D,E\}, \{D,B\}, \{D,A\}$   
E:  $\{E,A\}, \{E,B\}, \{E,D\}, \{E,C\}$

- A Straight line embedding is an embedding with all straight lines as edges

# About “Exist”

- Three good friends, an engineer, a mathematician and a computer scientist, are driving on a highway that is in the middle of nowhere. Suddenly one of the tires went flat and they have no spare tire.

# Maths vs CS vs Engineering

- Engineer

“Let’s use bubble gum to patch the tire and use the strew to inflate it again”

- Computer Scientist

“Let’s remove the tire, put it back, and see if it can fix itself again”

- Mathematician

“I can prove that there is a good tire exists in somewhere this continent”

# Planar Graph

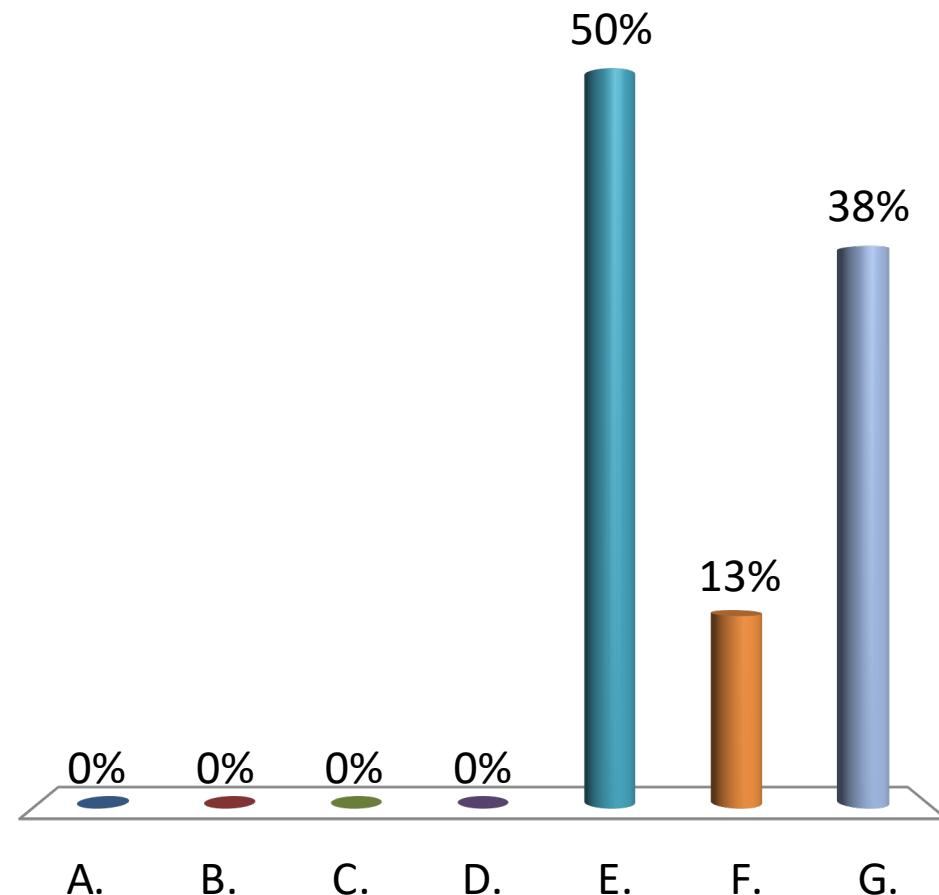

- Topologyists say,
  - If there exists an embedding for a graph, it's planar
  - If a graph is planar,  $V - E + F = 1 + C$

- Geometrists say
  - If a graph is planar, how do I draw it on a plane?

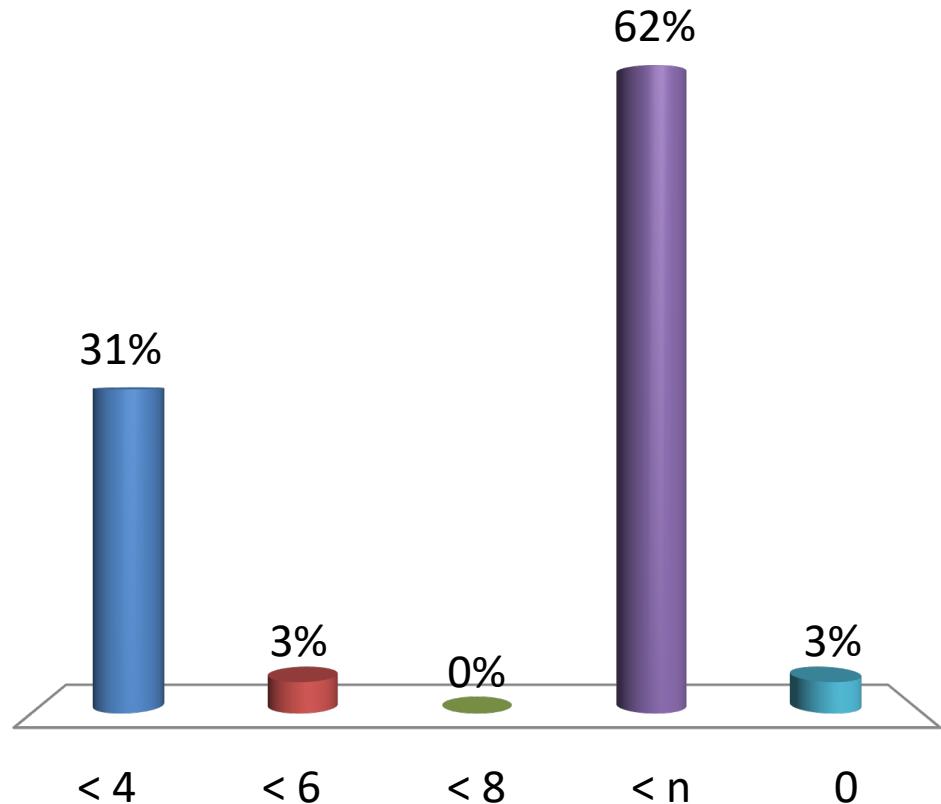

# What is the max degree of a planar graph?

- A. 2
- B. 4
- C. 6
- D. 8
- ✓ E.  $\sqrt{-1}$
- F.  $O(V^2)$
- G. To infinity and beyond!

# What is the average degree of a planar graph?

- A.  $< 4$
- B.  $< 6$
- C.  $< 8$
- D.  $< n$
- E. 0

# Before drawing, let's prove this

- The average degree of a node in a planar graph is less than 6
- Assuming maximally connected
  - Namely, a planar graph with the max. no. of edges
  - This implies that every face is a triangle

# Every node has a degree less than 6

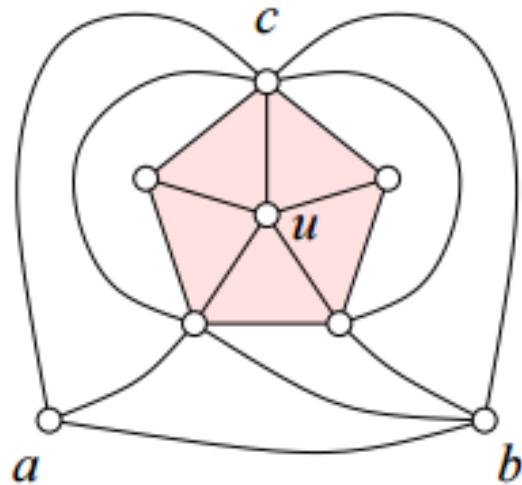

- $V - E + F = 1 + C$ 
  - $C = 1$
  - Every faces has 3 edges
    - $3F = 2E$
- $V - E + \frac{2E}{3} = 1$
- $E = 3V - 6$
- Average degree =  $\frac{2E}{V} < 6$

# Algorithm to draw a planar graph

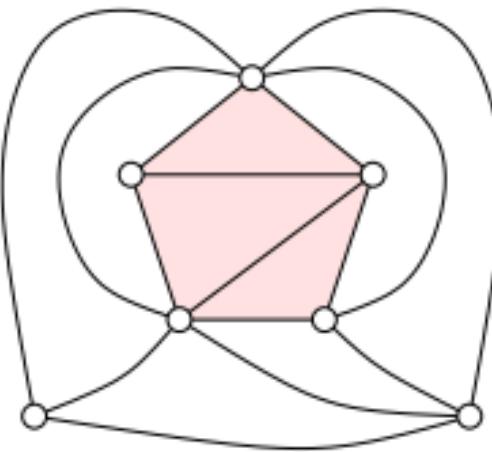

- Assuming  $G$  is maximally connected
- Repeat while  $G$  has more than 3 vertices
  - There is a vertex  $u$  in  $G$  with degree  $k_u < 6$ 
    - i.e. 3, 4, or 5
  - $G := G - \{v\}$
  - If the degree of  $u$  is more than 3, add artificial edge in  $G$  such that  $G$  is maximally connected
  - Push  $u$  onto a stack  $S$ , together with
    - the  $k_u$  neighbors of  $u$
    - the artificial edges added

# Algorithm to draw a planar graph

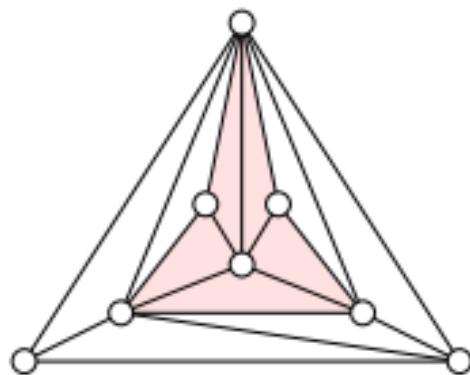

- $G$  has three vertices as a triangle, draw it anyway
- Repeat while  $S$  is not empty
  - Pop  $u$  from  $S$
  - Remove the artificial edges added
  - Draw  $u$  into the
    - Triangle, or
    - Quadrilateral, or
    - Pentagon

remove  $u$

recurse

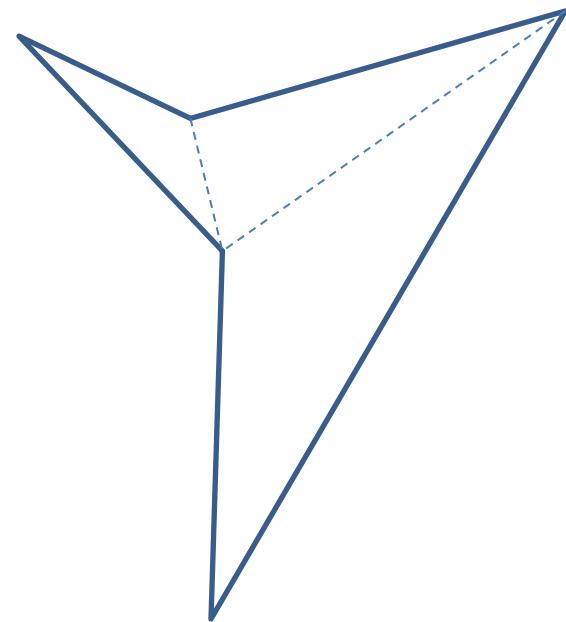

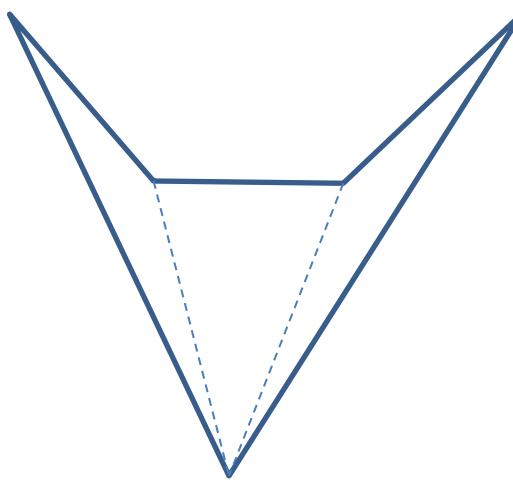

add back  $u$

# Can we always insert $u$ without intersection?

- Triangle
  - Trivial
- Quadrilateral
  - Draw  $u$  on the diagonal
- Pentagon
  - Proof?

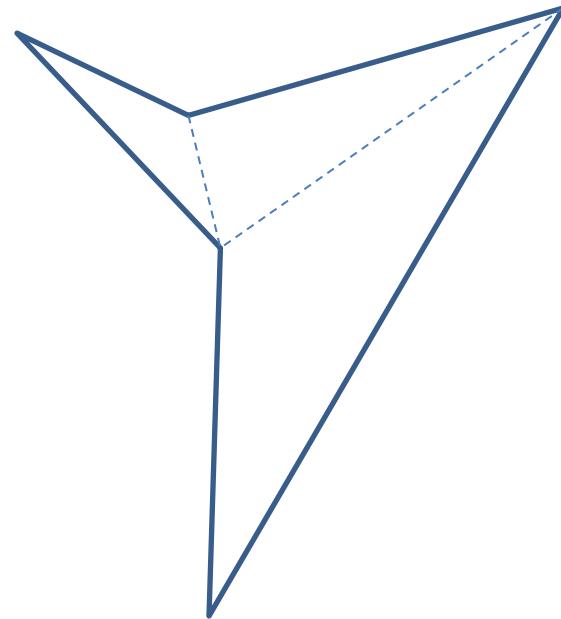

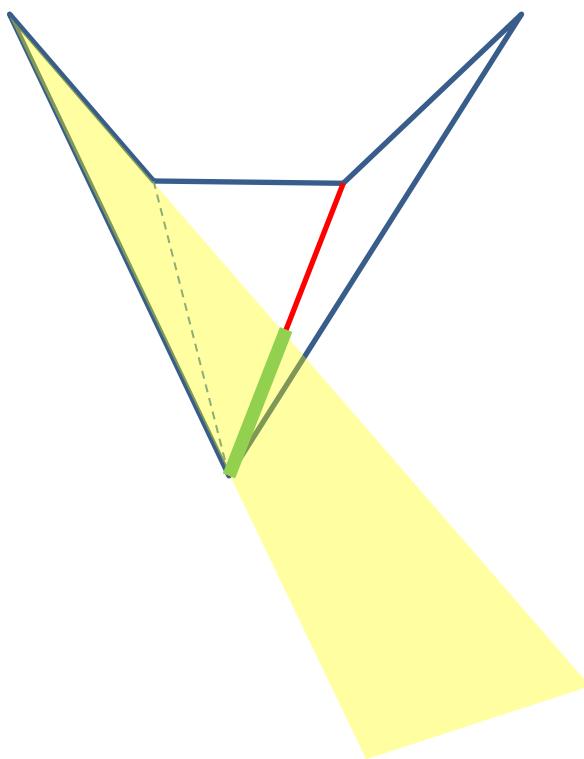

# Proof

- We can always divide a pentagon into three triangles

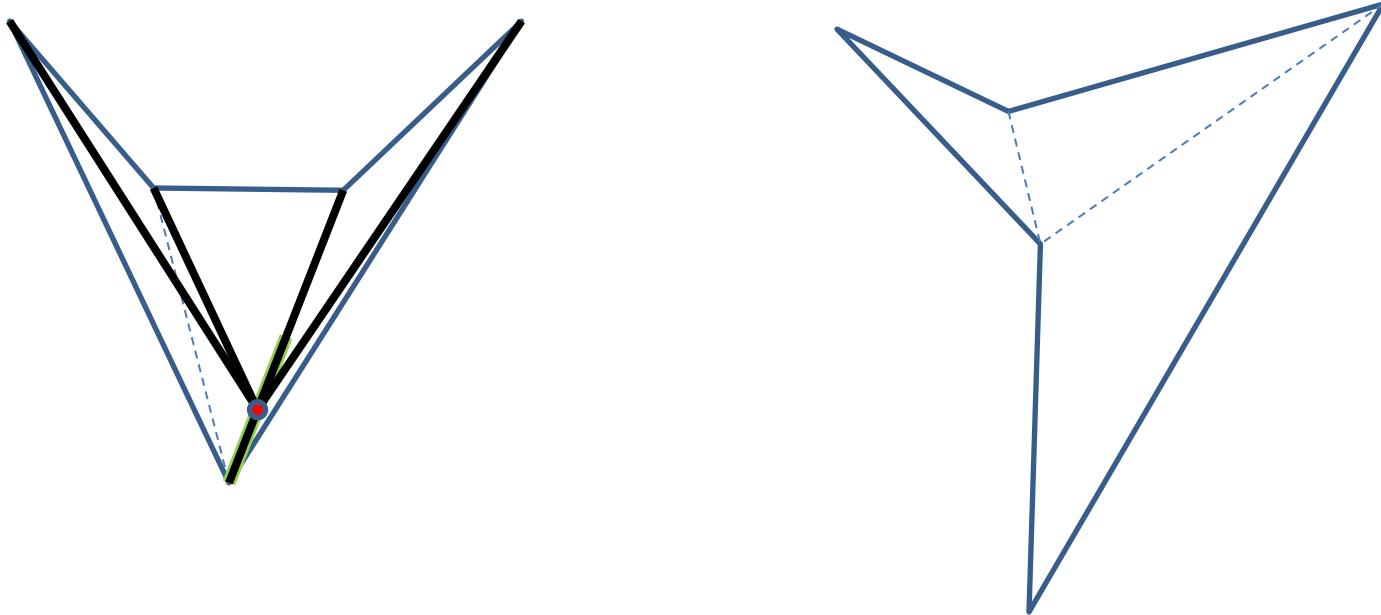

# Proof

- On one of the division line, you can project the other triangle onto it

# Proof

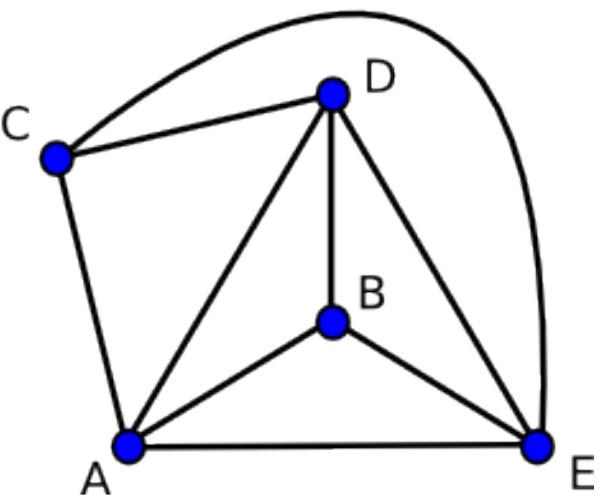

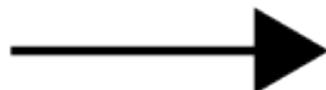

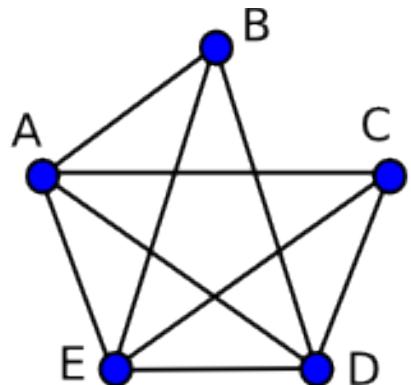

- And you can add a new point on this area and connect all the vertices of the pentagon without crossing

# Algorithm to draw a planar graph

- $G$  has three vertices as a triangle, draw it anyway
- Repeat while  $S$  is not empty
  - Pop  $u$  from  $S$
  - Remove the artificial edges added
  - Draw  $u$  into the
    - Triangle, or
    - Quadrilateral, or
    - Pentagon

# Example

- A:  $\{A,C\}, \{A,D\}, \{A,B\}, \{A,E\}$
- B:  $\{B,A\}, \{B,D\}, \{B,E\}$
- C:  $\{C,A\}, \{C,E\}, \{C,D\}$
- D:  $\{D,C\}, \{D,E\}, \{D,B\}, \{D,A\}$
- E:  $\{E,A\}, \{E,B\}, \{E,D\}, \{E,C\}$

# Example

- Remove A
  - Degree of A = 4
  - A's neighbor: B C D E
  - Add an artificial edge
    - E.g. C B

A → C D B E  
B → A D E  
C → A D E  
D → C E B A  
E → A B D C

Node	Neighbors	Artificial edge
A	B C D E	C B

- Stack:

# Example

- Remove B
  - Degree of B = 3
  - B's neighbor: C D E

B → C D E  
C → B D E  
D → C E B  
E → B D C

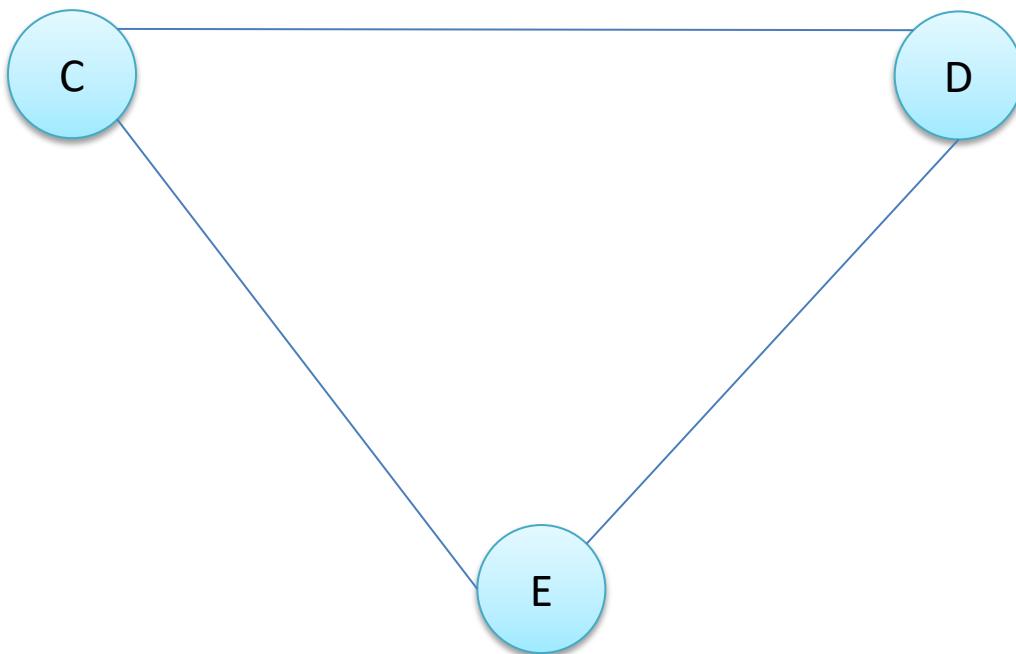

- Stack:

Node	Neighbors	Artificial edge
B	C D E	
A	B C D E	C B

# Example

- Three vertices left
- Draw it anyway

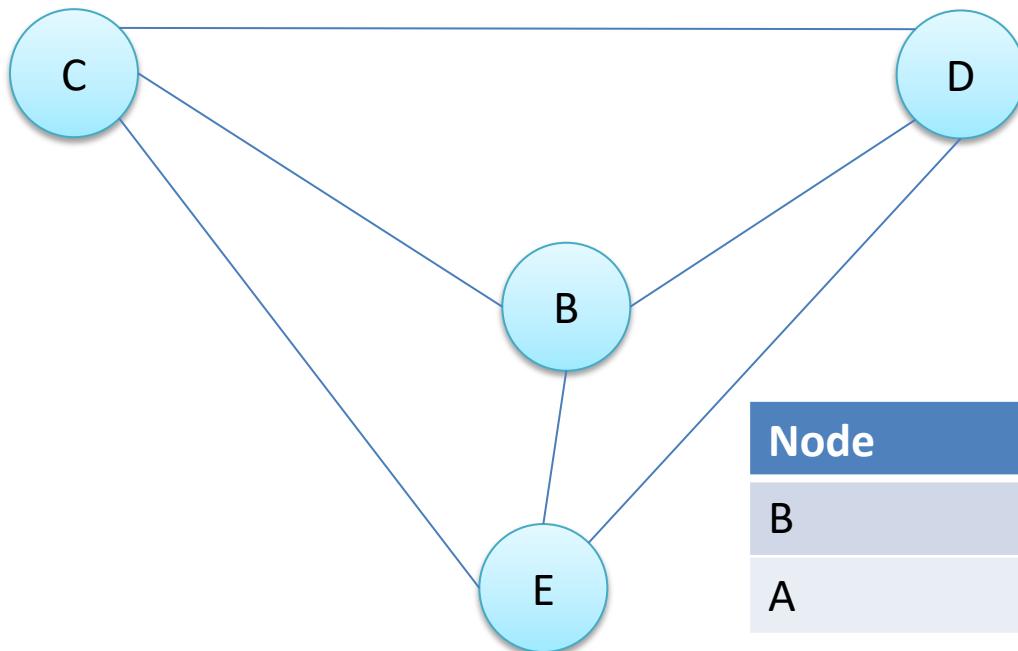

```
C → D E  
D → C E  
E → D C
```

# Example

- Pop B
  - B's neighbor: C D E

C → D E  
D → C E  
E → D C

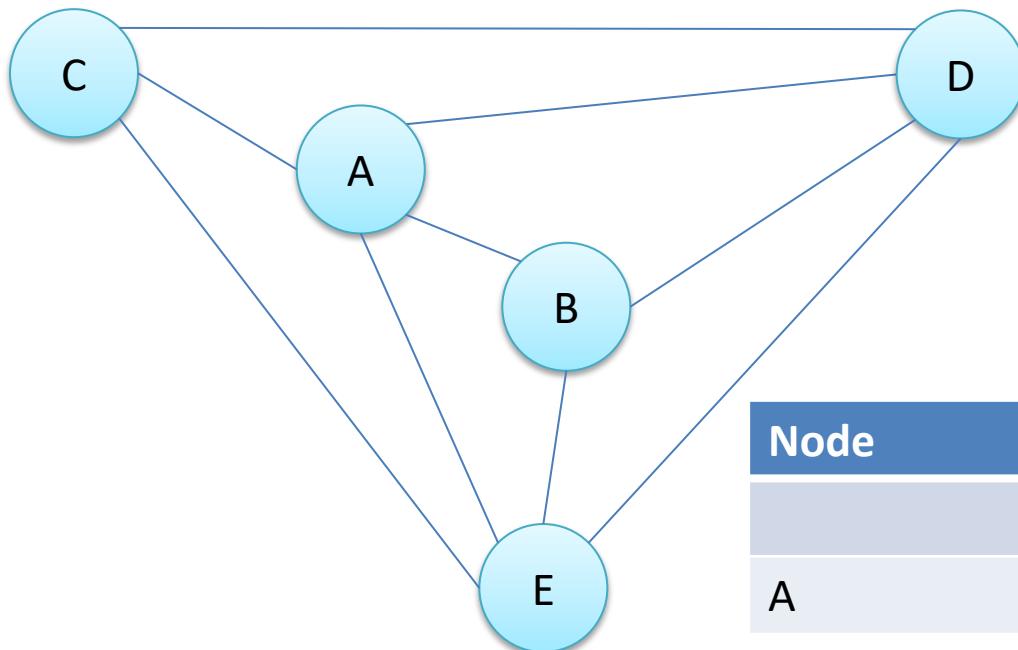

Node	Neighbors	Artificial edge
B	C D E	
A	B C D E	C B

# Example

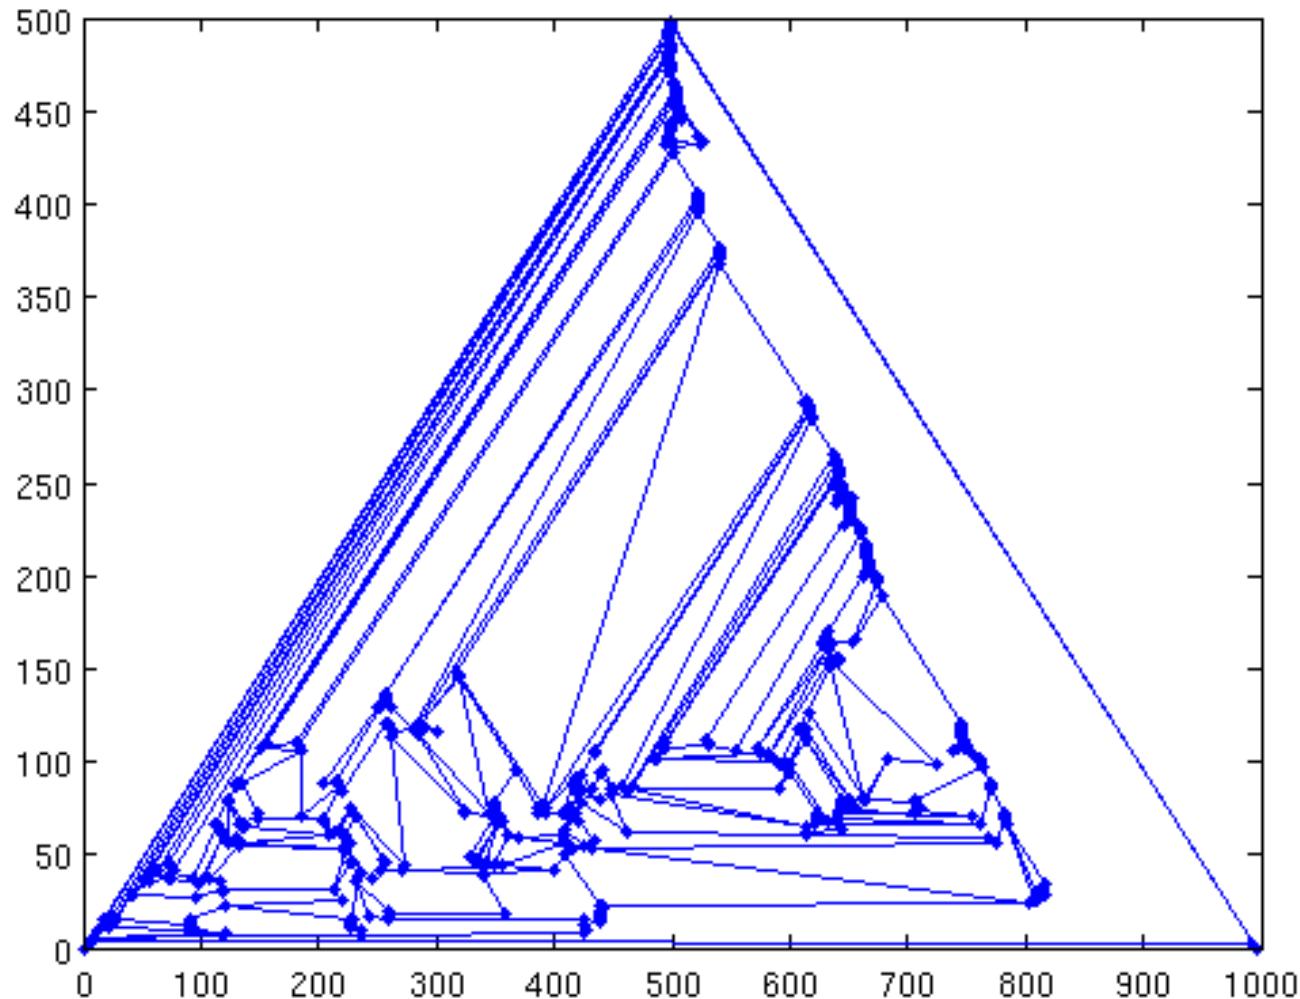

- Pop A
  - Remove artificial edge CB
  - A's neighbor: B C D E

```
C → D E  
D → C E  
E → D C
```

Node	Neighbors	Artificial edge
A	B C D E	C B

# But in general, not so good looking

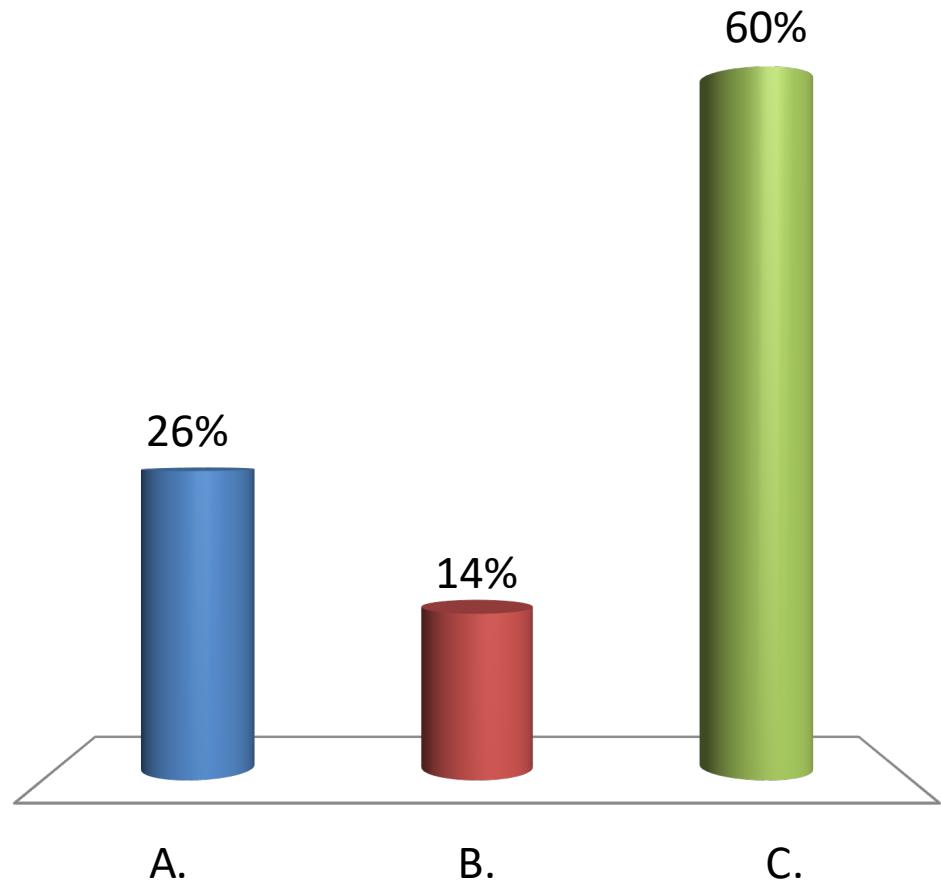

# Can I perform coloring as the same way?

- A vertex  $k$ -coloring on a graph colors the vertices with  $k$  different colors
  - And if two nodes share the same edge, the two nodes must have different colors

# How can we do a 6-coloring on a planar graph?

- A. Impossible
- B. Too difficult, let me go home and think
- C. Too easy, a piece of cake

# Algorithm to draw a planar graph

- Assuming  $G$  is maximally connected
- Repeat while  $G$  has more than 3 vertices
  - There is a vertex  $u$  in  $G$  with degree  $k_u < 6$ 
    - i.e. 3, 4, or 5
  - $G := G - \{v\}$
  - If the degree of  $u$  is more than 3, add artificial edge in  $G$  such that  $G$  is maximally connected
  - Push  $u$  onto a stack  $S$ , together with
    - the  $k_u$  neighbors of  $u$
    - the artificial edges added

# Algorithm to draw a planar graph

- $G$  has three vertices as a triangle, draw it anyway
- Repeat while  $S$  is not empty
  - Pop  $u$  from  $S$
  - Remove the artificial edges added
  - Draw  $u$  into the
    - Triangle, or
    - Quadrilateral, or
    - Pentagon
  - Just color  $u$  with a different color!

# Puzzle for you

- How can we do a 5-coloring on a planar graph?
  - What happen if we are adding a vertex with 5 neighbors but all of the neighbors have different colors

# About 4-coloring for Planar Graph

---

- Given a planar Graph
- Can you color each vertex with four colors only provided that each neighbor has a different color?

# History

---

- 1852 when Francis Guthrie, while trying to color the map of counties of England . Conjecture appeared in a letter from Augustus De Morgan
- 'Proof' by Kempe in 1879, Tait in 1880
  - Incorrectness was pointed out by Heawood in 1890
  - Petersen in 1891
- Confirmed by Appel and Haken in 1976 (1476)
- Again by Robertson, Sanders, Seymour and Thomas (633)

## A NEW PROOF OF THE FOUR-COLOUR THEOREM

NEIL ROBERTSON, DANIEL P. SANDERS, PAUL SEYMOUR, AND ROBIN THOMAS

(Communicated by Ronald Graham)

**ABSTRACT.** The four-colour theorem, that every loopless planar graph admits a vertex-colouring with at most four different colours, was proved in 1976 by Appel and Haken, using a computer. Here we announce another proof, still using a computer, but simpler than Appel and Haken's in several respects.

for two reasons:

- (i) part of the A&H proof uses a computer, and cannot be verified by hand, and
- (ii) even the part of the proof that is supposed to be checked by hand is extraordinarily complicated and tedious, and as far as we know, no one has made a complete independent check of it.

$c(u) \neq c(v)$  for every edge of  $G$  with ends  $u$  and  $v$ . This was conjectured by F. Guthrie in 1852, and remained open until a proof was found by Appel and Haken [3], [4], [5] in 1976.

Unfortunately, the proof by Appel and Haken (briefly, A&H) has not been fully accepted. There has remained a certain amount of doubt about its validity, basically for two reasons:

- (i) part of the A&H proof uses a computer, and cannot be verified by hand, and
- (ii) even the part of the proof that is supposed to be checked by hand is extraordinarily complicated and tedious, and as far as we know, no one has made a complete independent check of it.
